- ▶ String of n H/T's
- ▶ Run = sequence of pure Heads or pure Tails
- ▶ Example
 - ▶ String HHHTTTTHHHTHHHTTTT
 - ▶ Runs HHH TTT HHH T HHH TTTT
- ▶ Properties one can study:
 - ▶ Number of Runs
 - ▶ Distribution of Run Lengths
 - ▶ Longest Run

Permutation Distribution of Number of Runs

- ▶ String $S = (s_i)_{i=1}^n$ of n 1/0's
- ▶ n_1 1's, n_0 0's.
- ▶ $N(S) = \#Runs$
- ▶ Permuted String $S_\pi = (s_{\pi(i)})_{i=1}^n$.
- ▶ Permutation distribution

$$P_0(N = r) = \frac{\#\{\pi : N(S_\pi) = r\}}{n!}$$

- ▶ r even

$$P_{0,n}(N = 2k) = \frac{2 \binom{n_0-1}{k-1} \binom{n_1-1}{k-1}}{\binom{n_0+n_1}{n_1}}$$

- ▶ r odd

$$P_{0,n}(N = 2k + 1) = \frac{\binom{n_0-1}{k} \binom{n_1-1}{k-1} + \binom{n_0-1}{k-1} \binom{n_1-1}{k}}{\binom{n_0+n_1}{n_1}}$$

Multivariate
Runs Test

The two sequences shown below each purportedly represent the results of 200 tosses of a fair coin. One of these is an actual sequence obtained from coin tossing, while the other sequence is artificial. Can you decide, in sixty seconds or less, which of the sequences is more likely to have arisen from actual coin tossing and which one is the imposter?

Sequence #1

T H H H H T T T T H H H H T H H H H H H H H T T T H H T T H H H H H T T T T T H H T H H T H H H T
T T H T T H H H H T H T T T H T T T H H T T T T H H H H H H T T T H H T T H H H T H H H H H T T T T

Runs Test

The above challenge is based on a classroom experiment originally performed by Révész [14]. The class is divided into two groups. In the first group, each student is instructed to toss a coin 200 times and record the resulting sequence of heads and tails. Each student in the second group is merely to write down a sequence of heads and tails that the student believes is a reasonable *simulation* of 200 tosses of a fair coin. Given the combined results of the two groups, Révész claims that the students can be classified back into their original groups with a surprising degree of accuracy by means of a very simple criterion: In students' simulated patterns, the longest run of consecutive heads or consecutive tails is almost invariably *too short* relative to that which tends to arise from actual coin tossing.

runif()

Two-Sample
Permutation Tests
Goodness-of-Fit
Testing

Multivariate
Runs Test

- ▶ R_n longest run of pure heads, in string with $n_1/n = p$

$$E[R_n] \approx \log_{1/p}(nq) + \gamma / \log(1/p) - 1/2$$

$$\text{Var}[R_n] \approx \frac{\pi^2}{6} \log^2(1/p) + \frac{1}{12}$$

- ▶ In case $p = 1/2$:

$$E[R_n] \approx \log_2(n/2) - 2/3$$

- ▶ $E[R_{200}] \approx 7$

Multivariate
Runs Test

A very easy rule of thumb is that the longest head run for a fair coin is very likely to be within three either way from the integer nearest to $\log_2(n/2)$. Applying this rule for $n = 200$, we find that reasonable limits for R_{200} are 4 and 10. The actual probability that the longest head run is between these values turns out to be 95.3%, which slightly exceeds the lower bound of 94.5% guaranteed by Table 1. For R'_{200} , the longest run of heads *or* of tails in 200 tosses, simply add one to each of the limits.

Multivariate
Runs Test

We have

- ▶ Theory: F_0 .
- ▶ Observations: $X_i \sim_{iid} F$.
- ▶ Hypotheses:

$$H_0 : F = F_0 \quad H_A : F \neq F_0.$$

Goodness-of-Fit Testing, 2

Analysis of
Runs

Number of Runs
Longest Run

Testing
runif()

Two-Sample
Permutation Tests

Goodness-of-Fit
Testing

Multivariate
Runs Test

Distribution-free Tests, 1

- ▶ Theory: F_0
- ▶ Observations: $X_i \sim_{iid} F$
- ▶ Would-be Uniform RV's

$$Y_i = F_0(X_i)$$

- ▶ Theorem: *if X_i iid F_0 continuous, then Y_i iid $Unif[0, 1]$*

Goodness-of-Fit Testing, 2

Distribution-free Tests, 2

- ▶ $F_n^Y(t) = \frac{1}{n} \sum_{i=1}^n 1\{Y_i \leq t\}$
- ▶ $U(t) = t$
- ▶ Discrepancy measure

$$D(\{X_i\}_{i=1}^n; F_0, \Delta) = \Delta(F_n^Y, U)$$

- ▶ Here Δ is a user-supplied measure of discrepancy;
Examples:

- ▶ Kolmogorov-Smirnov

$$\Delta_{KS}(F, G) = \sup_t |F(t) - G(t)|.$$

- ▶ Anderson-Darling

$$\Delta_{AD}(F, G) = \int_0^1 |F(t) - G(t)|^2 dt.$$

Goodness-of-Fit Testing, 3

Distribution-free Tests, 3

- ▶ Theorem: *Under H_0 , the probability distribution of $D(\{X_i\}_{i=1}^n; F_0, \Delta)$ is the same for all F_0 with a continuous CDF.*
- ▶ Additionally, for many discrepancies, when F_0 is *not* continuous, the RV $D(\{X_i\}_{i=1}^n; F_0, \Delta)$ is stochastically smaller.
- ▶ Consequently, define a critical value $\delta(\alpha) \equiv \delta(\alpha; \Delta, n)$

$$P\{D(\{V_i\}_{i=1}^n; U, \Delta) \geq \delta\} = \alpha,$$

where V_i $i = 1, \dots, n$ is iid $U[0, 1]$, then, for every choice of a null hypothesis $H_0 : F = F_0$, we have

$$P_{H_0}\{D(\{X_i\}_{i=1}^n; F_0, \Delta) \geq \delta\} \leq \alpha.$$

- ▶ This means that we get a rigorously valid level- α test using

$$\text{Reject } H_0 \text{ if } D(\{X_i\}_{i=1}^n; F_0, \Delta) \geq \delta(\alpha, n)$$

Multivariate
Runs Test

- ▶ Two Samples $X = (X_i)_{i=1}^{n_X}$; $Y = (Y_i)_{i=1}^{n_Y}$
- ▶ Combine and sort: $Z = \text{sort}(c(X, Y))$
- ▶ For simplicity, assume no collisions: $X \cap Y = \emptyset$.
- ▶ $(s_j)_{j=1}^n$ binary labels:

$$s_j = \begin{cases} 1 & z_j \in Y \\ 0 & z_j \in X \end{cases}.$$

- ▶ Supply (s_j) to R's `runs.test()`.
- ▶ Motivation: Under null, adjacent samples equally likely same/different origin
Under alternative, runs signal observations from *same* origin

Graph-Based Two-Sample Tests

- ▶ The Friedman and Rafsky test is a generalization of Wald-Wolfowitz runs test to higher dimensions
- ▶ The difficulty is that we need to sort observations
- ▶ Friedman and Rafsky purpose to use minimal spanning trees as a multivariate generalization of the univariate sorted list

Runs Test

- ▶ Has been applied to mapping cell populations in flow cytometry data (Hsiao et al. 2016)
 - ▶ two cell populations
 - ▶ d measurements on each cell
 - ▶ determine whether the expression of a cellular marker is statistically different
 - ▶ suggesting candidates for new cellular phenotypes
 - ▶ indicate splitting or merging of cell populations
- ▶ Recent development for very high-dimensional data sets (Chen and Friedman 2015)

Wald-Wolfowitz Two-Sample runs test is **consistent against all alternatives**.

- Suppose that critical value $\nu_\alpha(n_X, n_Y)$ for N_n is normalized

$$P_{0,n}\{N_n(s^{X,Y}) > \nu_\alpha(n_X, n_Y)\} = \alpha$$

- Suppose that $F_X \neq F_Y$, $n_X, n_Y \rightarrow \infty$,
 $n_X/(n_X + n_Y) \rightarrow \gamma \in (0, 1)$:

$$\lim_{n \rightarrow \infty} P_{F_X, F_Y}\{N_n(s^{X,Y}) > \nu_\alpha(n_X, n_Y)\} = 1.$$
